

TIRED MINDS MAKE RISKY DECISIONS

Fatigue reduces performance long before you notice it.

Fatigue is a state of physical and mental exhaustion that affects judgement, reaction time, and decision-making. It builds up over time and is influenced by sleep, workload, stress, and work patterns. Fatigue significantly increases the risk of errors, incidents, and injuries, often without the individual realising their performance is impaired.

KNOW THE SIGNS

Reduced concentration, slower reactions, poor judgement, low energy, irritability. Recognise fatigue early and check Fitness for Work guidance.

SPEAK UP EARLY

Reporting fatigue is encouraged and blame-free. Take breaks, adjust workloads, or reassign tasks, protecting yourself protects the team.

MANAGE HIGH-RISK TASKS

Rotate roles during high-focus work, use checklists and verification steps, and work in pairs where possible to reduce risk and maintain safe performance.

SLEEP FUELS SAFETY

Good sleep improves memory, health, and emotional control. Sleep loss increases accidents, illness, and poor decision-making.

CHECK YOUR SLEEP HEALTH

Complete the Sleep Health self-report questionnaire (sent separately). Remember to calculate your own sleep health before submitting.
